

Was the study's sample population a true or close representation of the target population?

Was some form of random selection used to select the sample or was a census undertaken?

Was the likelihood of non-response bias minimal?

Were data collected directly from subjects (as opposed to a proxy)?

Was an acceptable case definition used in the study?

Was the study instrument that measured the parameter of interest shown to have reliability and validity?

Was the same mode of data collection used for all subjects?

Were the numerator and denominator for the parameter of interest appropriate?

Overall bias assessment

High risk of bias

Low risk of bias

Moderate risk of bias
